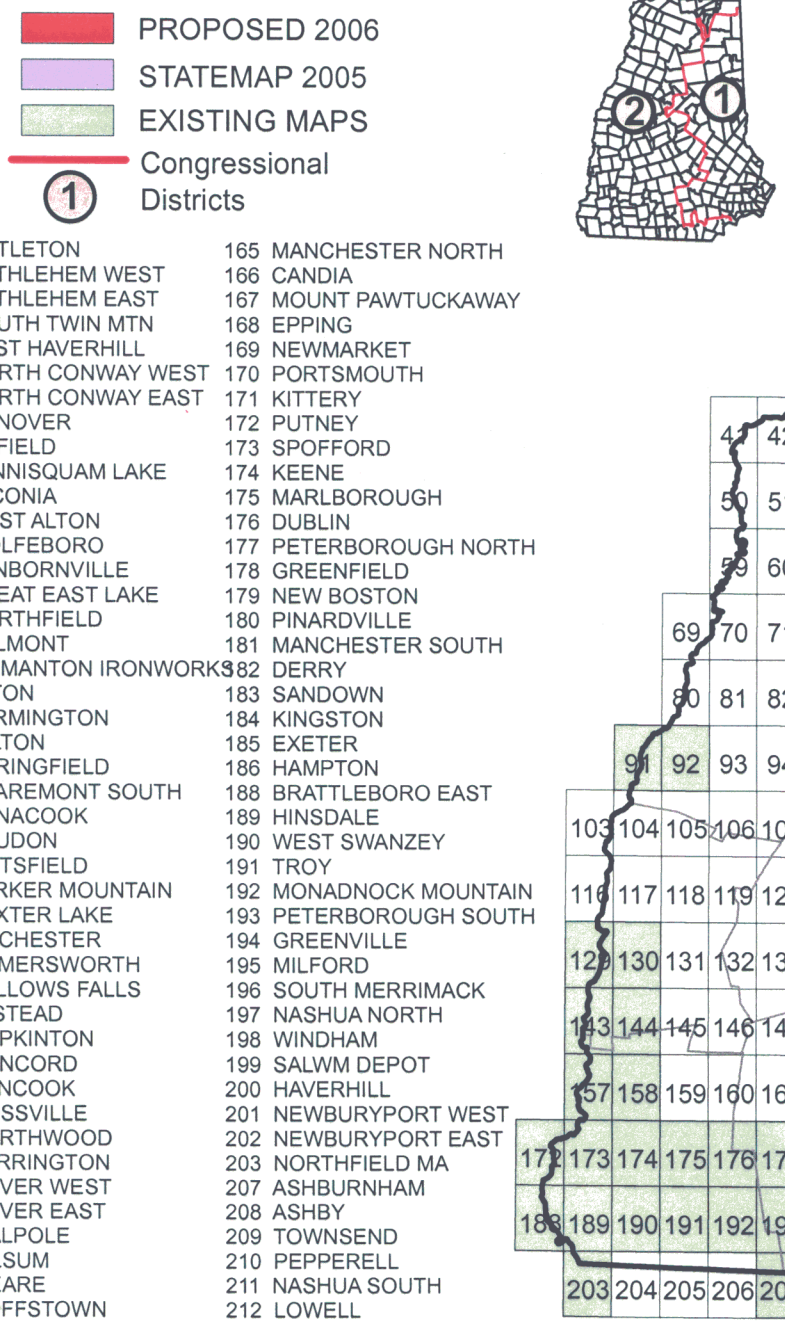
National Cooperative Geologic Mapping Program

NEW HAMPSHIRE INDEX OF SURFICIAL GEOLOGIC MAPS STATUS



43 LITTLETON
44 BETHLEHEM WEST
45 BETHLEHEM EAST
54 SOUTH TWIN MTN
60 EAST HAVERHILL
66 NORTH CONWAY WEST
67 NORTH CONWAY EAST
91 HANOVER
92 ENFIELD
110 WINNISQUAM LAKE
111 LACONIA
112 WEST ALTON
113 WOLFEBORO
114 SANBORNVILLE
115 GREAT EAST LAKE
123 NORTHFIELD
124 BELMONT
125 GILMANTON IRONWORKS
126 ALTON
127 FARMINGTON
128 MILTON
129 SPRINGFIELD
130 CLAREMONT SOUTH
136 PENACOOK
137 LOUDON
138 PITTSFIELD
139 PARKER MOUNTAIN
140 BAXTER LAKE
141 ROCHESTER
142 SOMERSWORTH
143 BELLOWS FALLS
144 ALSTEAD
149 HOPKINTON
150 CONCORD
151 SUNCOOK
152 GOSSVILLE
153 NORTHWOOD
154 BARRINGTON
155 DOVER WEST
156 DOVER EAST
157 WALPOLE
158 GILSUM
163 WEARE
164 GOFFSTOWN
165 MANCHESTER NORTH
166 CANDIA
167 MOUNT PAWTUCKAWAY
168 EPPING
169 NEWMARKET
170 PORTSMOUTH
171 KITTERY
172 PUTNEY
173 SPOFFORD
174 KEENE
175 MARLBOROUGH
176 DUBLIN
177 PETERBOROUGH NORTH
178 GREENFIELD
179 NEW BOSTON
180 PINARDVILLE
181 MANCHESTER SOUTH
182 DERRY
183 SANDOWN
184 KINGSTON
185 EXETER
186 HAMPTON
188 BRATTLEBORO EAST
189 HINSDALE
190 WEST SWANZEY
191 TROY
192 MONADNOCK MOUNTAIN
193 PETERBOROUGH SOUTH
194 GREENVILLE
195 MILFORD
196 SOUTH MERRIMACK
197 NASHUA NORTH
198 WINDHAM
199 SALWM DEPOT
200 HAVERHILL
201 NEWBURYPORT WEST
202 NEWBURYPORT EAST
203 NORTHFIELD MA
207 ASHBURNHAM
208 ASHBY
209 TOWNSEND
210 PEPPERELL
211 NASHUA SOUTH
212 LOWELL

SUMMARY OF STATEMAP
GEOLOGIC MAPPING PROGRAM IN NEW HAMPSHIRE

Federal Fiscal Year	96	97	98	99	00	01	02	03	04	05	06	Total
STATEMAP Award	$35,000	$50,000	$48,000	$60,000	$25,000	$52,465	$41,545	$45,000	$68,717	$53,556	$52,400	$531,683

What is a Geologic Map

Geologic maps are an important source of natural-resource information. They depict the underlying bedrock (solid rock near the earth's surface) or surficial geologic materials (e.g., alluvium, glacial deposits), as if the soils and vegetation had been removed. In New Hampshire, bedrock consists of igneous and metamorphic (crystalline) rocks. Alluvium - which consists of unconsolidated sand, gravel, clay, and silt in stream valleys – is younger than the underlying bedrock. Glacial deposits consist of material that has been transported by glaciers and deposited directly by the ice (glacial till) or by glacial melt water (glacial drift) on the underlying bedrock. In some areas, these deposits can be hundreds of feet thick. Geologic maps graphically show the rock type, age, and horizontal distribution of bedrock and surficial deposits near the earth's surface. Geologic maps also show the related geologic structures (faults, fractures, and folds) that would be exposed if the soils were stripped away.

A geologic map shows the distribution of rock units and other geologically related information within a specific geographic area. Each rock unit is identified and named based on distinctive characteristics that can be mapped over large distances. Geologic maps provide a way of presenting the three-dimensional shape of the bedrock geology on a flat piece of paper using lines, symbols, and colors.

Benefits and Uses

Geologic maps are usually the starting point for any geologically related investigation. They are useful in construction and engineering projects, city and county planning, and in a variety of environmental assessments. Large projects (dams, roads, bridges, buildings) require detailed geologic analysis because of monetary, health, and safety concerns. Smaller projects, such as surface water impoundments, houses and water wells, benefit from an understanding of the surficial geology. For example, if a farm pond is located in porous glacial deposits (such as sand and gravel), these materials may function as a drain, and the pond will not hold water. If placed in a less porous unit (such as glacial till, which contains clay), the pond should not leak. This basic information about the local geology can be ascertained from a geologic map. Other examples of how geologic maps can be used are listed below.

-Evaluation of geologic hazards (landslides, earthquakes, land subsidence)
-Planning transportation and utility routes
-Site selection for public facilities (landfills, treatment facilities, waste-disposal sites, schools)
-Land-use planning and evaluation of land-use proposals
-Regulatory decision-making
-Environmental assessment and protection planning (underground storage tanks, landfills, aquifer contamination)
-Development and protection of ground water
-Natural-resource assessment, exploration, development, and management
-Basic earth-science research

Recent Outcome from NHGS Mapping Program

The New Hampshire Geological Survey (NHGS) completed the 1:24,000 surficial geology map of the Laconia quadrangle, which encompasses part of the Lakes Region of New Hampshire. The Lake Region is dominated by scenic landscapes and offers vast recreational opportunities. These livable traits make this area one of the most densely populated regions in central New Hampshire. However, the area is also one of the most seismically active in the northeast, and has been the site of at least three moderate earthquakes (M 4.0 to 6.0) in the last six decades. Seismic risk is related to the aging infrastructure that is ubiquitous to one of the oldest states in the union. NHGS has been active in disseminating information and conducting outreach activities to communities in the Lakes Region related to earthquake hazard and risk. NHGS presented the Laconia surficial and state bedrock map to the city of Laconia's planning division to aid in their land-use planning efforts, and to provide critical information that was used in the preparation of their state-mandated Hazard Mitigation Plan. The sharing of this vital information with the city was highlighted in a news article, and since its publication, several more communities have requested NHGS geological maps and information for hazard mitigation plans and land-use planning.

Geologic Mapping in New Hampshire

The New Hampshire Geological Survey (NHGS), a unit of the NH Department of Environmental Services, actively participates in the U.S.G.S. Federal Cooperative STATEMAP program. New Hampshire has been glaciated several times in recent geologic history, and the resulting surficial geologic materials directly affect all forms of land use. As a result, NHGS mapping has focused on completing geologic mapping of these surficial materials. The engineering properties of these surficial deposits have significant implications for highway and building-foundation construction, and waste management. In addition, much of the water supply for the state's communities is derived from surficial deposits. Geologic maps are important sources of information for aiding in water-supply evaluation and protection, land-use planning, transportation design, resource evaluation, recreation, and seismic-risk evaluation. Comprehensive geologic information is needed to address these issues and to provide the foundation for proper planning and preventative measures to ameliorate these and other environmental problems in the future. To date, NHGS has completed surficial geologic mapping in 83 of the 213 quadrangles that encompass the state, which amounts to approximately 39% completion. The map on the opposite side shows the status of surficial mapping for the state.
